

Nippy's | South Australia | Agriculture | MYOB Exo

Founded in the Riverland of South Australia in the early 1930's, Nippy's is one of those great Australian companies still doing what it does best – delivering fresh produce to the people of Australia.

Things might operate on a larger scale now than they used to, but the product has stayed pretty much the same in over 60 years. What has changed is its structure.

Nippy's is now a much more horizontal organisation, with managers taking their share of responsibility for different areas – instead of all the decisions being taken up top. And that's had a profound effect on how information on sales and stock is shared around the business.

Back in the good old days

For several years, Nippy's had been using two accounting systems side by side – MYOB Premier for general ledger, and a proprietary DOS program to record debtors. According to Ben Knispel, the company's accountant, both were good.

“We needed data to be readily available across the business, not just at the top. And our existing system couldn't manage that.”

“Premier was easy to use, and great value for money,” he also says that, “Despite its age, the DOS program, chugged along nicely. But that was also its downfall. In the end, I guess we just outgrew them both”.

The Solution

Nippy's spent a couple of months looking at possible replacements, including SAP, before finding MYOB's Exo. “Exo was being implemented locally by software solutions company Axsys – and we'd heard good things about both. So we contacted Axsys and asked to see the system in action.”

Working with Axsys

Once having met with Axsys, Knispel states, “It didn’t take us long to realise that MYOB Exo had the functionality we needed – reporting capabilities, multiple access, good stock control and bill of materials, as well as a company with a sound reputation supporting it”.

Knispel says they were really interested to see how MYOB Exo handled stock - partly because they’d never had that kind of functionality before. “We weren’t disappointed.”

“When the guys at Axsys showed us Exo’s bill of materials using dummy data... Everything came alive for us.”

Nippy’s was also keen to get distribution work flows set up in Exo as soon as possible. “We have a number of self employed distributors who take our juice all over Australia to outlets like Coles and Woolworths,” says Knispel.

“Although an essential process, the system we were using to track deliveries, payments and reimbursements was hugely complicated – involving triplicate dockets and a lot of manual inputting back in the office.”

Knispel continues, “We needed Axsys to create a system in Exo that would not only replicate this process, but vastly simplify it too.”

Learning the new system

Once MYOB Exo was up and running, Knispel believes it took most users about two weeks to feel confident using it.

He states, “The big thing when you’re adjusting to any new system like this, is to realise that no matter how much testing and preparation you do, you’ll only find out how it really works once you start using it”.

“So in many respects,” he adds, “instead of focusing all your resources on testing, you’re better off making sure there’s plenty of support on hand after you’ve gone live”.

Having all the data at the core

A few months down the line, Nippy’s has noticed several big improvements with MYOB Exo – not least the time it saves on certain tasks.

“We must have saved 20 hours a week alone handling our distribution process - that’s half a full time role.”

“We now know exactly what we’ve sold too – and whether we’ve sold more or less than we did last month – or last year”, says Knispel.

It's all down to having information in one place. Instead of having debtors stored in one data base and sales and general accounting data in another, Exo holds everything centrally – which means that anybody at Nippy's can dip into the system and pull out what they need.

Real-time reliability

It's not just the ability to access information centrally that's transformed workflow at Nippy's. The ability to access and use information that's up to date has had a dramatic effect on Nippy's stock keeping and reporting.

Since adopting Exo, Nippy's has been able to move away from a periodic to a perpetual inventory system. Exo's real time stock system also provides live product costing – something that previously could only be done by creating Excel workbooks and manually entering historical prices.

“Before Exo, if we wanted an accurate margin calculation from, say, our last quarter, we'd have to dig around to find out exactly how much we paid for our stock during that period. Either that, or use average prices and get only a rough margin figure,” stays Knispel.

With Exo however, every time you buy something, the cost of that item flows through the entire system resulting in real time margin calculations.

Better Visibility: Inside and Out

Of course none of this information would be useful if it still had to be exported to Excel and manipulated to make sense. That's why Exo reports are designed to provide a clear understanding of all aspects of the business, whether you're looking for a snapshot view of sales, want to keep an eye on debtors – or just need some assistance decision making.

In Conclusion

Knispel concludes, “On a day to day basis, Exo gives us a better understanding of what is going on in and outside the walls of our warehouse. But in the long term, it has provided us with a platform to roll out across our sites over time – so that we can consolidate the group into one financial package. And that's its real value”

Before MYOB Exo

- Two accounting systems that couldn't talk to each other
- Lots of manual information inputting for deliveries
- Critical information in separate silos

After MYOB Exo

- + Consolidated financials and seamless integration
- + Data workload reduced by 20-plus hours a week
- + Clear insight into all areas of our business all
